The matrix kinship model

Our analysis is based on a kinship model that is described in great detail in a series of published papers. Each of these publications adds additional demographic processes. (1) presents the basic model: single-sex, age-structured, and time-invariant demographic rates. (2) incorporates multistate demography, with an application to age-parity classification. (3) incorporates time-varying demographic rates. (4) extends the model to include both sexes, with the ability to include male and female fertility and mortality schedules when available. (5) expands the analysis of the death of kin to include competing causes of death. All these papers are available in open access. An R package that implements the model is available (6).

Here we give only an overview of the model, first in its simplest form, and then in the two-sex time-varying version used in our analyses. We recommend that the interested reader consult the published literature for details.

The simple kinship model. In its simplest form, the model analyzes the kinship network shown in Figure S1. This form considers only female kin through female lines of descent, for age-classified populations, with time-invariant rates. The network, is defined relative to a focal individual, referred to as Focal, who is a member of a population with specified mortality and fertility schedules, which apply to all individuals. The survival matrix $\mathbf{U}$ contains survival probabilities on the subdiagonal and zeros elsewhere. The fertility matrix $\mathbf{F}$ contains age-specific fertilities in the first row and zeros elsewhere. The population is characterized by a distribution $\boldsymbol{\pi}$ of the ages of mothers at the birth of children.

The essential aspect of the model is to treat the kin, of any type, of Focal as a population and to project the age structure of that population. The 14 types of kin shown in the network are traditional, but the branches of the network can be extended as far as desired. The model incorporates only biological kin and (at present) does not accommodate step-kin or blended families.

The age structure vector of each type of kin is given by a unique letter (e.g., $\mathbf{a}(x)$ is the age distribution of the daughters at age x of Focal),

Let $\mathbf{k}$ be the age structure vector of an arbitrary kin type ($\mathbf{k}$ does not appear in Figure S1 so it can be used this way). The dynamics of kin are

$$\mathbf{k}(x+1) = \mathbf{U}\mathbf{k}(x) + \boldsymbol{\beta}(x) \quad [1]$$

$$\mathbf{k}(0) = \mathbf{k}_0 \quad [2]$$

The kin at age $x+1$ of Focal are the survivors of the kin at age x plus a vector of new recruits $\boldsymbol{\beta}(x)$. New recruits, if any, come from another kin type (e.g., new granddaughters are the offspring not of granddaughters, but of daughters). In that case

$$\mathbf{k}(x+1) = \mathbf{U}\mathbf{k}(x) + \mathbf{F}\mathbf{k}^*(x) \quad [3]$$

where $\mathbf{k}^*$ is the other kin type. Some kin receive no new recruits (e.g., Focal can gain no more older sisters after she is born). In that case

$$\mathbf{k}(x+1) = \mathbf{U}\mathbf{k}(x) + \mathbf{0} \quad [4]$$

Each type of kin requires an initial condition, giving the age structure of that type of kin at the birth of Focal. Some of these initial conditions are zero (e.g., Focal has no daughters at birth). Others are calculated using information from the age distribution of the mothers at the birth of offspring (age at maternity). For example, we know that Focal, at birth, has exactly one living mother. We do not know her age, but we know the distribution of that age, so for mothers ($\mathbf{d}(x)$) we write

$$\mathbf{d}_0 = \boldsymbol{\pi} \quad [5]$$

As is the case with all cohort component projections, this model projects expected values of the kinship network.

The time-varying two-sex kinship model. Our analysis uses the matrix kinship model extended to include both sexes and time varying demographic rates.* We define time-varying male and female rates and the sex ratio at birth

$$\mathbf{U}_f(t), \mathbf{U}_m(t) = \text{period female and male survival matrices at time } t \quad [6]$$

$$\mathbf{F}_f(t), \mathbf{F}_m(t) = \text{period female and male fertility matrices at time } t \quad [7]$$

$$\alpha = \text{proportion males among offspring} \quad [8]$$

$$\bar{\alpha} = 1 - \alpha \quad [9]$$

The survival matrices contain age-specific survival probabilities on the subdiagonal and zeros elsewhere. Fertility matrices contain age-specific fertility rates on the first row and zeros elsewhere. Fertility includes both female and male children of female and male parents. We set the proportion of males at birth as $\alpha = 0.5$.

The age distribution of each type of kin is extended to include both males and females:

$$\tilde{\mathbf{k}}(x, t) = \left(\frac{\mathbf{k}_f}{\mathbf{k}_m} \right) (x, t). \quad [10]$$

* This section is modified from (3) and (4) under the terms of a CC-BY license.

Fig. S1. The kinship network of a Focal individual. Each letter is the age distribution vector of a particular kind of kin. Reproduced from (1) under a CC-BY license.

60 The tilde denotes block-structured vectors and matrices composed of female and male parts.

61 The block-structured vector is projected by the time-varying block-structured matrices

$$62 \quad \tilde{\mathbf{U}}_t = \left(\begin{array}{c|c} \mathbf{U}_f(t) & \mathbf{0} \\ \hline \mathbf{0} & \mathbf{U}_m(t) \end{array} \right) \quad \tilde{\mathbf{F}}_t = \left(\begin{array}{c|c} \bar{\alpha}\mathbf{F}_f(t) & \bar{\alpha}\mathbf{F}_m(t) \\ \hline \alpha\mathbf{F}_f(t) & \alpha\mathbf{F}_m(t) \end{array} \right) \quad \tilde{\mathbf{F}}_t^* = \left(\begin{array}{c|c} \bar{\alpha}\mathbf{F}_f(t) & \mathbf{0} \\ \hline \alpha\mathbf{F}_f(t) & \mathbf{0} \end{array} \right) \quad [11]$$

63 The dynamics of $\tilde{\mathbf{k}}(x, t)$ are

$$64 \quad \tilde{\mathbf{k}}(x+1, t+1) = \tilde{\mathbf{U}}_t \tilde{\mathbf{k}}(x, t) + \tilde{\boldsymbol{\beta}}(x, t). \quad [12]$$

65 The term $\tilde{\boldsymbol{\beta}}(x, t)$ is the recruitment of new kin. It depends on the nature of the kin that provide the new kin.

- 66 1. If the recruitment of new kin of type $\mathbf{k}$ is provided by reproduction of a direct ancestor of Focal (parents, grandparents,
67 etc.) then

$$68 \quad \left(\begin{array}{c} \beta_f \\ \beta_m \end{array} \right) (x, t) = \left(\begin{array}{c|c} \bar{\alpha}\mathbf{F}_f(t) & \mathbf{0} \\ \hline \alpha\mathbf{F}_f(t) & \mathbf{0} \end{array} \right) \left(\begin{array}{c} \mathbf{k}_f^* \\ \mathbf{k}_m^* \end{array} \right) (x, t) \quad [13]$$

$$69 \quad \tilde{\boldsymbol{\beta}}(x, t) = \tilde{\mathbf{F}}^* \tilde{\mathbf{k}}(x, t) \quad [14]$$

70 where $\mathbf{k}^*$ denotes the source kin (e.g., parents of Focal are the source of younger siblings of Focal). The matrix $\tilde{\mathbf{F}}^*$
71 includes reproduction of both female and male offspring by females.

- 72 2. If the recruitment is provided by any other kin type, then

$$73 \quad \left(\begin{array}{c} \beta_f \\ \beta_m \end{array} \right) = \left(\begin{array}{c|c} \bar{\alpha}\mathbf{F}_f(t) & \bar{\alpha}\mathbf{F}_m(t) \\ \hline \alpha\mathbf{F}_f(t) & \alpha\mathbf{F}_m(t) \end{array} \right) \left(\begin{array}{c} \mathbf{k}_f^* \\ \mathbf{k}_m^* \end{array} \right) \quad [15]$$

$$74 \quad \tilde{\boldsymbol{\beta}}(x, t) = \tilde{\mathbf{F}} \tilde{\mathbf{k}}(x, t) \quad [16]$$

75 where $\tilde{\mathbf{k}}^*(x, t)$ again denotes the source of the recruited kin (e.g, children of Focal are the source of new grandchildren).

- 76 3. If there is no recruitment of new kin of type $\mathbf{k}$, then $\tilde{\boldsymbol{\beta}} = \mathbf{0}$.

77 **Our implementation of the kinship models.** Our implementation of the kinship models is equivalent to that of (4), with some
78 exceptions that we outline here. First, we assume time-invariant rates and a stable distribution of kin by age before 1950—i.e.,
79 the ‘time boundary’ in (3). This is the first year for which demographic rate data from the 2022 Revision of the World
80 Population Prospects (UNWPP) (7) is available. Second, for computational efficiency, we group ages and years by 5 y groups
81 instead of running single-year models.

82 Third, we modeled ‘flow’ births as opposed to ‘birth-pulse’ populations, meaning that births are distributed along a given
83 age interval (8). We use survival relationships (S) instead of probabilities at exact ages, so that the age-specific fertility rates
84 in ages $(x, x+5)$ prevailing during interval time $(t, t+5)$, become:

$$85 \quad F_{t,t+5}(x, x+5) = \frac{f_{t,t+5}(x, x+5) + f_{t,t+5}(x+5, x+10)S_{t,t+5}(x, x+5)}{2} \frac{L_{t,t+5}(0, 5)}{l_0 5} \quad [17]$$

86 Here, $L_{t,t+5}(0, 5)$ are the person-years between birth and age 5 prevailing in the period between t and $t+5$, and l_0 is the
87 radix of the life table (9). Note that the rates at each time interval $(t, t+5)$ take the value of the intermediate year.

88 The diagram in Fig. S2 illustrates how our models estimate living kin counts by sex and type of kin for a female Focal. Solid
89 lines in the diagram show which kin is subsidized from another kin (see (1) for a discussion of subsidies in kinship models). As
90 in (4), our model uses female fertility when accounting for sibling relations (i.e., Focal’s siblings or Focal’s aunts and uncles,
91 who are Focal’s parents siblings). This is indicated with a dotted line in Fig. S2.

92 Additional analyses related to the implementation of the kinship models

93 **Comparing model and empirical kinship data.** It has long been recognized that formal kinship models are not expected to
94 reproduce the results of empirical or census measurements (1, 10) because the models describe the kinship network implied by
95 a set of mortality and fertility schedules, whereas census measurements reflect not only mortality and fertility, but many other
96 processes not included in the model. Hence it is useful to compare the model with empirical measurements to assess their
97 differences.

98 We use registry-based measurements of kinship for Sweden to assess the accuracy of our model-derived estimates of kinship.
99 (11) generated period kin counts for different types of biological relatives for Sweden in the year 2017. To the best of our
100 knowledge this constitutes the only study to present a comprehensive account of kin availability for most of the relatives
101 presented in this study.

102 In order to evaluate the performance of our kinship models, we compare three different model formulations to the empirical
103 data. ‘GKP factors’ extrapolate from one-sex models to accounting for both sexes by simple multiplication (e.g., siblings =

Fig. S2. Kinship diagram showing the different kin ties considered in the two-sex kinship models used for the study (4), excluding greatgrandparents and greatgrandchildren for convenience. Women are circles and men are triangles. Relatives are identified by a unique code: uom = uncles older than mother, uym = uncles younger than mother, com = cousins from uncles/aunts older than mother, ob = older brothers, d = daughters, nys = nieces/nephews (niblings) from younger sisters, gd = grand-daughters, etc. The dotted lines indicate that sibling relations are determined using female (i.e., maternal) fertility.

sisters $\times 2$). ‘Full two-sex’ models use empirical male and female mortality and fertility data (available for Sweden from the Human Fertility Collection). ‘Androgynous fertility’ models (the ones we use for the analysis in this project) approximate male fertility by setting it equal to female (4). All models rely on a time-variant implementation of the kinship models, as explained above.

Fig. S3 shows the expected number of kin for the three models alongside the empirical data from (11) for Sweden. The plot shows that our androgynous fertility models were able to capture the expected kin count with a high level of precision for most relative types. Note that the large differences for cousins, grandchildren, niblings and uncles/aunts at older ages of Focal arise from limitations in the empirical data and not with our models. Registry-based estimates are underestimated for these type of kin for some birth cohorts as they information on kin ties for older periods is unavailable—i.e., information on grandparents is needed in order to identify cousins (11).

This exercise supports our assertion that the assumption of pre-1950 demographic stability in the kinship models does not affect our projections of kinship considerably for a country that experienced a post-WWII ‘baby boom.’ This echoes the findings of previous studies using related methods and data to estimate country-level kinship structure for a number of countries (12, 13).

Exploring the androgynous approximation. As we outlined in the main text, to fully incorporate vital rates of both sexes requires age-specific mortality and fertility schedules for both males and females for all the years of study. Male and female mortality are regularly reported. Male fertility is rarely reported, and is not available for the range of countries and years that we consider here. Thus an approximation to male fertility is needed. (4) discusses several such approximations. The approximation that we adopted uses male and female mortality schedules, and treats male fertility as equal to female fertility; this is called an “androgynous” approximation by (4). Under this scenario, the model provides both male and female kin, and

Fig. S3. Comparing kin counts from multiple sources for Sweden in 2017. Estimates labelled as 'Kolk' are registry-based calculations published by (11). The other three models are implemented using matrix kinship models that rely on three different approximations of male fertility, as explained in the text. The estimates in the main text rely on the 'Androgynous fertility' variant.

allows them to experience different survival schedules.

When both male and female fertility schedules are available, it is possible to compare the full two-sex model with the androgynous approximation. (4) compared the numbers of kin at different ages of Focal, between a full two-sex model and a completely androgynous model (female rates used for both mortality and fertility) and found very good agreement even when the actual male and female fertility schedules were dramatically different. Here, we perform a comparative analysis using the same model setup as in Section *Comparing model and empirical kinship data*. To make these results directly comparable to the analysis in the main text, we group survival probabilities, fertility rates, and kin age classes into 5-y groups. All analyses pertain to Sweden.

Overall, the analysis shows a high consistency between the androgynous and the full two-sex model. We start by considering the number of living kin irrespective of the age of kin. Fig. S4 shows the expected number of living kin in 2015 over the life course of Focal (i.e., the expected number of kin irrespective of the age of kin). The results show the both models produce highly comparable estimates of kin. Next, in order to evaluate the magnitude of the discrepancies, we compute the Mean

Absolute Difference (MAD) in the expected kin size by type of kin for 2015. To estimate this measure, we first obtained a vector of all the (absolute) differences between the androgynous and the full-two sex models (i.e., for all the kin types considered, all the ages of kin, and Focal's ages 0, 35, and 65). We then obtained the mean of these differences (in number of kin) and present them by type of kin, averaging over all ages of kin. Table S1 shows that the MAD is smaller than 0.037 relatives for all kin types considered (i.e., the largest mean difference between the benchmark full two-sex models and the approximation provided by the androgynous model is 0.037 relatives). We find the largest discrepancies for a Focal aged 0. This is expected as the age distribution of kin at this age reflects the initial conditions of the model.

This supplementary analysis provides reassuring evidence that the approximation of androgynous fertility provides empirically-plausible kinship distributions, as anticipated by (4). Whereas we find some differences in the expected number of kin between the androgynous and the full two-sex models, these are not large and mainly affect distant ancestors. We emphasize that in an ideal world we would conduct full two-sex models for all countries in the world but male fertility data are only available for a small subset of countries in the global North. Our androgynous approach is the best solution for providing a global picture given the data limitations we face.

Single-year versus abridged matrix kinship models. The kinship model proposed by (1) was implemented initially for single years. In this paper, we use the same model but conduct the analysis on a five-yearly basis (i.e., we use abridged matrix kinship models). We do this to reduce memory usage and computational time. Running single-year models for 230 countries, 101 ages of Focal, 101 ages of kin, 2 sexes, 14 kin types, 72 observed years, and 1000 trajectories for 78 projection years would produce a dataset with around 3.7×10^{14} rows. Here, we show that the abridged model produces results very similar to those of the single-year implementation.

Our abridged analysis is, by definition, less precise than the single-age one. This limitation is similar to the one affecting the classical five-year abridged cohort component method of population projection. We assume that fertility rates are constant within each age group and that cohort changes (i.e., survival) happen linearly. As a result, female exposures can be estimated by taking the average within each interval. Similarly, infant mortality is merged in the survival ratio for newborns, known as S_b in life table notation. The latter is more important for populations with high rates of infant mortality.

Next, we evaluate the degree to which single-year and abridged kinship models produce equivalent estimates. For this, we apply both model sets to China in a female time-variant framework and consider differences in kin counts by kin type at different ages of Focal. We use the published UNWPP median trajectory for each demographic component (7).

Figures S5, S6 and S7 show that, on the whole, both models are highly consistent. The larger inconsistencies, in relative terms, are present when kin counts are very small, indicating that a given relative type is fairly uncommon at a given age of Focal. For example, we find relatively large discrepancies for the number of great-grandmothers for a focal aged 65. This is expected given the very small counts for these kin-age combinations and is not a major reason for concern. Overall, the fit between the two implementations improves over time, as we can see for the case of cousins, sisters and nieces for a Focal aged 0. Great-grandmothers are an exception: we document a discrepancy between the models for great-grandmothers for a focal aged 0. This is partly derived from the fact that the model assumes an initial stable distribution of mothers, grandparents and great-grandparents (i.e., the 'age-boundary'), leading to a small over-estimation of these kin types relative to the single-year model.

Regional groupings

We group territories into regions as defined by the 2022 Revision of the World Population Prospects (UNWPP)[†]. These are:

Africa

Algeria; Cote d'Ivoire; Angola; Benin; Botswana; Burkina Faso; Reunion; Burundi; Cabo Verde; Cameroon; Central African Republic; Chad; Comoros; Congo; Democratic Republic of the Congo; Djibouti; Egypt; Equatorial Guinea; Eritrea; Eswatini; Ethiopia; Gabon; Gambia; Ghana; Guinea; Guinea-Bissau; Kenya; Lesotho; Liberia; Libya; Madagascar; Malawi; Mali; Mauritania; Mauritius; Mayotte; Morocco; Mozambique; Namibia; Niger; Nigeria; Rwanda; Saint Helena; Sao Tome and Principe; Senegal; Seychelles; Sierra Leone; Somalia; South Africa; South Sudan; Sudan; Togo; Tunisia; Uganda; United Republic of Tanzania; Western Sahara; Zambia; Zimbabwe.

Asia

Turkiye; Afghanistan; Armenia; Azerbaijan; Bahrain; Bangladesh; Bhutan; Brunei Darussalam; Cambodia; China; Hong Kong SAR; Macao SAR; Taiwan, China; Cyprus; Dem. People's Republic of Korea; Georgia; India; Indonesia; Iran (Islamic Republic of); Iraq; Israel; Japan; Jordan; Kazakhstan; Kuwait; Kyrgyzstan; Lao People's Democratic Republic; Lebanon; Malaysia; Maldives; Mongolia; Myanmar; Nepal; Oman; Pakistan; Philippines; Qatar; Republic of Korea; Saudi Arabia; Singapore; Sri Lanka; State of Palestine; Syrian Arab Republic; Tajikistan; Thailand; Timor-Leste; Turkmenistan; United Arab Emirates; Uzbekistan; Viet Nam; Yemen.

Europe

Albania; Andorra; Austria; Belarus; Belgium; Bosnia and Herzegovina; Bulgaria; Croatia; Czechia; Denmark; Estonia; Faroe Islands; Finland; France; Germany; Gibraltar; Greece; Guernsey; Holy See; Hungary; Iceland; Ireland; Isle of Man; Italy; Jersey; Kosovo (under UNSC res. 1244); Latvia; Liechtenstein; Lithuania; Luxembourg; Malta; Monaco; Montenegro; Netherlands; North Macedonia; Norway; Poland; Portugal; Republic of Moldova; Romania; Russian Federation; San Marino; Serbia; Slovakia; Slovenia; Spain; Sweden; Switzerland; Ukraine; United Kingdom.

[†] <https://population.un.org/wpp/>, accessed 12 Jan 2023

Table S1. Mean absolute difference (MAD) in the expected number of kin between the androgynous fertility and the full two-sex models for 2015 Sweden The MAD considers all differences between male and female kin by type of kin.

Kin type	Age of Focal		
	0	35	65
Aunts	0.009	0.008	0.003
Uncles	0.009	0.008	0.003
Daughters	0.000	0.000	0.000
Sons	0.000	0.000	0.000
Grandmothers	0.011	0.006	0.000
Grandfathers	0.033	0.013	0.000
Great-grandmothers	0.023	0.003	0.000
Great-grandfathers	0.037	0.003	0.000
Mother	0.000	0.000	0.000
Father	0.015	0.015	0.003
Sisters	0.000	0.000	0.000
Brothers	0.000	0.000	0.000

194 **Latin America and the Caribbean**

195 Anguilla; Saint Bartholemy; Antigua and Barbuda; Argentina; Aruba; Bahamas; Barbados; Belize; Bolivia (Plurinational
196 State of); Bonaire, Sint Eustatius and Saba; Brazil; British Virgin Islands; Cayman Islands; Chile; Colombia; Costa Rica; Cuba;
197 Dominica; Dominican Republic; Ecuador; El Salvador; Falkland Islands (Malvinas); French Guiana; Grenada; Guadeloupe;
198 Guatemala; Guyana; Haiti; Honduras; Jamaica; Martinique; Mexico; Montserrat; Nicaragua; Panama; Paraguay; Peru; Puerto
199 Rico; Saint Kitts and Nevis; Saint Lucia; Saint Martin (French part); Saint Vincent and the Grenadines; Sint Maarten (Dutch
200 part); Suriname; Trinidad and Tobago; Turks and Caicos Islands; United States Virgin Islands; Uruguay; Venezuela (Bolivarian
201 Republic of); Curacao.

202 **Northern America**

203 Bermuda; Canada; Greenland; Saint Pierre and Miquelon; United States of America.

204 **Oceania**

205 American Samoa; Australia; Cook Islands; Fiji; French Polynesia; Guam; Kiribati; Marshall Islands; Micronesia (Fed. States
206 of); Nauru; New Caledonia; New Zealand; Niue; Northern Mariana Islands; Palau; Papua New Guinea; Samoa; Solomon
207 Islands; Tokelau; Tonga; Tuvalu; Vanuatu; Wallis and Futuna Islands.

208 **Excluded territories** Given data limitations, we exclude the following territories from our analysis: Channel Islands, Holy
209 See, Pitcairn, and Sark, Wallis, and Futuna Islands.

210 **Extended data visualisations**

211 In this section, we present additional visualisations to complement the graphics in the main manuscript. The results presented
212 in this section pertain to:

- 213 • Regional estimates of total family size (Figs. [S8-S9](#))
- 214 • Regional estimates of horizontal and vertical family size (Figs. [S10-S12](#))
- 215 • Average number of kin in five selected countries (Figs. [S13-S14](#))
- 216 • Kin composition of family networks (Figs. [S15-S20](#))

217 **Tables with country-level kin counts**

218 In this section, we provide three tables with detailed country-level estimates of kinship structure. The tables are given for a
219 Focal aged 0-4, 35-39, and 65-69, respectively. Countries are identified by a unique three-letter ISO code. Each table presents
220 the estimates for selected type of kin for three years: 1950-1955, 2020-2025, and 2095-2100. Note that projected data only
221 shows the median value of the 1000 country-level projections. Values in each table are expected kin counts, as in the main
222 manuscript. Full results, by type of kin, country, year, age of Focal, and age of kin, including median and lower and upper 80%
223 projection intervals, are available at the Harvard Dataverse ([14](#)).

Fig. S4. Expected number of kin over the life course of Focal in 2015 Sweden by sex of kin (results presented by 5y groups, as in the main text). Column A: Models assume that male fertility is equivalent to female fertility (i.e., 'androgynous fertility'). Column B: Models use real male and female fertility ('full two-sex'). Column C: Absolute difference between expected number of living kin (Column A - Column B).

Fig. S5. Comparative number of female living kin for a Chinese Focal at age class 0 (i.e., age 0 for single-year models and age 0-4 for abridged models). Single-year estimates are shown every 10 years.

Fig. S6. Comparative number of female living kin for a Chinese Focal at age class 35 (i.e., age 35 for single-year models and age 35-39 for abridged models). Single-year estimates are shown every 10 years.

Fig. S7. Comparative number of female living kin for a Chinese Focal at age class 65 (i.e., age 65 for single-year models and age 65-69 for abridged models). Single-year estimates are shown every 10 years.

Fig. S8. Total family size (the sum of all living great-grandparents, grandparents, parents, children, grandchildren, great-grandchildren, aunts/uncles, nieces, siblings, and cousins) for a 0 yo female Focal in different world regions (Panels A-E) and globally (Panel F). Light-blue lines in the background show country-level values (median projection trajectory after 2021). The thick black line shows the regional values; after 2021, the black lines show the projection median and the red lines represent the 80% projection intervals for each region (averages weighted by country-level population size at Focal's age 0).

Fig. S9. Total family size (the sum of all living great-grandparents, grandparents, parents, children, grandchildren, great-grandchildren, aunts/uncles, nieces, siblings, and cousins) for a 35 yo female Focal in different world regions (Panels A-E) and globally (Panel F). Light-blue lines in the background show country-level values (median projection trajectory after 2021). The thick black line shows the regional values; after 2021, the black lines show the projection median and the red lines represent the 80% projection intervals for each region (averages weighted by country-level population size at Focal's age 35).

Fig. S10. Family size by horizontal (great-grandparents, grandparents, parents, children, grandchildren, and great-grandchildren) and vertical (aunts/uncles, niblings, siblings, and cousins) family type for a 0 yo female Focal. Regions are: A = Africa, B = Asia, C = Europe and Northern America, D = Latin America and the Caribbean, E = Oceania, F. World. Light-blue lines in the background show country-level values (median projection trajectory after 2021). The thick black line shows the regional values; after 2021, the black lines show the projection median and the red lines represent the 80% projection intervals for each region (averages weighted by country-level population size at Focal's age 0).

Fig. S11. Family size by horizontal (great-grandparents, grandparents, parents, children, grandchildren, and great-grandchildren) and vertical (aunts/uncles, nieces, siblings, and cousins) family type for a 35 yo female Focal. Regions are: A = Africa, B = Asia, C = Europe and Northern America, D = Latin America and the Caribbean, E = Oceania, F = World. Light-blue lines in the background show country-level values (median projection trajectory after 2021). The thick black line shows the regional values; after 2021, the black lines show the projection median and the red lines represent the 80% projection intervals for each region (averages weighted by country-level population size at Focal's age 35).

Fig. S12. Family size by horizontal (great-grandparents, grandparents, parents, children, grandchildren, and great-grandchildren) and vertical (aunts/uncles, niblings, siblings, and cousins) family type for a 65 yo female Focal. Regions are: A = Africa, B = Asia, C = Europe and Northern America, D = Latin America and the Caribbean, E = Oceania, F = World. Light-blue lines in the background show country-level values (median projection trajectory after 2021). The thick black line shows the regional values; after 2021, the black lines show the projection median and the red lines represent the 80% projection intervals for each region (averages weighted by country-level population size at Focal's age 65).

Fig. S13. Average number of living kin for a Focal woman aged 0 in selected countries. Grey lines in background after 2021 show 100 trajectories from the 2022 Revision of the United Nations World Population Prospects. The continuous lines show the median of these projections and the dashed lines indicate the 80% projection intervals.

Fig. S14. Average number of living kin for a Focal woman aged 35 in selected countries. Grey lines in background after 2021 show 100 trajectories from the 2022 Revision of the United Nations World Population Prospects. The continuous lines show the median of these projections and the dashed lines indicate the 80% projection intervals.

Fig. S15. Expected number of selected kin for a newborn woman in China (Panel A), a Focal aged 35 (Panel B), and a Focal aged 65 (Panel C). Grey lines in background after 2021 show 100 trajectories estimated using probabilistic trajectories from the 2022 Revision of the United Nations World Population Prospects. Thick lines indicate the median estimates and dashed lines show the 80% projection intervals.

Fig. S16. Expected number of selected kin for a newborn woman in Brazil (Panel A), a Focal aged 35 (Panel B), and a Focal aged 65 (Panel C). Grey lines in background after 2021 show 100 trajectories estimated using probabilistic trajectories from the 2022 Revision of the United Nations World Population Prospects. Thick lines indicate the median estimates and dashed lines show the 80% projection intervals.

Fig. S17. Expected number of selected kin for a newborn woman in India (Panel A), a Focal aged 35 (Panel B), and a Focal aged 65 (Panel C). Grey lines in background after 2021 show 100 trajectories estimated using probabilistic trajectories from the 2022 Revision of the United Nations World Population Prospects. Thick lines indicate the median estimates and dashed lines show the 80% projection intervals.

Fig. S18. Expected number of selected kin for a newborn woman in Italy (Panel A), a Focal aged 35 (Panel B), and a Focal aged 65 (Panel C). Grey lines in background after 2021 show 100 trajectories estimated using probabilistic trajectories from the 2022 Revision of the United Nations World Population Prospects. Thick lines indicate the median estimates and dashed lines show the 80% projection intervals.

Fig. S19. Expected number of selected kin for a newborn woman in the United States of America (Panel A), a Focal aged 35 (Panel B), and a Focal aged 65 (Panel C). Grey lines in background after 2021 show 100 trajectories estimated using probabilistic trajectories from the 2022 Revision of the United Nations World Population Prospects. Thick lines indicate the median estimates and dashed lines show the 80% projection intervals.

Fig. S20. Expected number of selected kin for a newborn woman in Zimbabwe (Panel A), a Focal aged 35 (Panel B), and a Focal aged 65 (Panel C). Grey lines in background after 2021 show 100 trajectories estimated using probabilistic trajectories from the 2022 Revision of the United Nations World Population Prospects. Thick lines indicate the median estimates and dashed lines show the 80% projection intervals.

Table S2. Living kin for a female Focal aged 0-4. Country-level averages for selected years (values for 2095-2100 refer to the median of the 1,000 country-level projections). Relative codes: ggd = great-grandchildren, gd = grandchildren, d = children, n = niblings, s = siblings, c = cousins, m = parents, a = aunts/uncles, gm = grandparents, ggm = great-grandparents.

Table S3. Living kin for a female Focal aged 35-39. Country-level averages for selected years (values for 2095-2100 refer to the median of the 1,000 country-level projections). Relative codes: ggd = great-grandchildren, gd = grandchildren, d = children, n = niblings, s = siblings, c = cousins, m = parents, a = aunts/uncles, gm = grandparents, ggm = great-grandparents. (continued)

Table S4. Living kin for a female Focal aged 65-69. Country-level averages for selected years (values for 2095-2100 refer to the median of the 1,000 country-level projections). Relative codes: ggd = great-grandchildren, gd = grandchildren, d = children, n = niblings, s = siblings, c = cousins, m = parents, a = aunts/uncles, gm = grandparents, ggm = great-grandparents. (continued)
